

Zero Trust Services Assignment

Intro

This assignment is intended to evaluate your hands-on capabilities, give you a taste for the work we do, and show us how you communicate complex subjects in writing. You can refer to: [Zero Trust Services](#), [Cloudflare Docs](#) and the [Cloudflare Dashboard](#).

Please keep in mind that, while we can help point you in the right direction, the objective is to evaluate your ability to learn new concepts quickly through effective research and self-discovery. The Cloudflare offering is vast, and it is crucial that you are comfortable researching answers on topics you may not be familiar with. This assignment is designed to be completed under free tier services.

Deliverables

1. A working application secured by Cloudflare ZTNA.
2. A report that addresses the following:
 - a. A summary detailing how you implemented the technical requirements.
 - b. Did you learn anything during this assignment? What issues did you run into (if any) and how did you overcome them?
 - c. Did you apply any best practices?
 - d. Please let us know if you have any questions with any of the above. For any documentation shared, PDF format is encouraged.

Additional Considerations:

- Keep the audience in mind: your reviewers are technical experts on Cloudflare, but also want to understand how you can communicate complex topics to non-technical stakeholders.
- Technical deliverables are largely mutually exclusive. If you have trouble with any of the specific tasks this should not deter or prevent you from completing the remainder of the tasks.
- You will need to be ready to discuss your homework in the next round of interviews.

Zero Trust Network Access

Zero Trust Network Access (ZTNA) technologies create secure boundaries around applications. When resources are protected with ZTNA, users are only allowed to access resources after verifying the identity, context, and policy adherence of each specific request.

Pre-requisites

1. Set up your [Zero Trust account](#)
2. Self hosted Application - Need a hosted Application that is internet accessible on HTTP , SSH etc
3. SaaS based Application - Could be any SaaS based application
4. IDP - Could be GSuite, Azure AD, ADFS (or any other of your preference) or can use [One Time Pin](#)
5. [WARP Client](#) on your test device
6. Please add a domain (new or existing) to Cloudflare. [Ref](#)

Steps

Access

Self-Hosted

1. Onboard the self hosted Application on to Cloudflare
2. Allow access to the self hosted HTTP application to only Testers group in IdP so that they can test the application functionality
3. Ensure that the application cant be accessed by anyone else other than Testers
Create a Allow/Deny List to Allow selected users for example
["admin@example.com"](#) to access application

SaaS

1. Onboard any SaaS application of your choice to Cloudflare Platform
Configure SaaS application to use Cloudflare as IdP
2. Allow access to SaaS applications to only SaaS User group and block access to other users
3. Create a whitelist to allow ["admin@example.com"](#) to access the SaaS application

Gateway

1. [Install WARP on your device](#) and login to your Cloudflare Gateway instance and verify that the traffic is flowing via WARP. Ensure that no one else other than users defined in your IdP group can enroll to your instance.
2. Create a DNS Filtering policy to block all the Anonymizer and Malware traffic. Once deployed, traffic to anonymizer.testcategory.com and malware.testcategory.com should be blocked.
3. [Define policies](#) to block all traffic to Entertainment sites except for Netflix or YouTube etc.
